

# IMPORTANT! PLEASE READ BEFORE ASSEMBLING YOUR SHUFFLEBOARD!

- The playfield of your new shuffleboard is made of high-quality, solid wood. Wood is a natural product that is affected by environmental conditions like humidity and temperature.
- You should consider the placement of your shuffleboard carefully before assembly. Your shuffleboard should only be assembled in the location where you intend to use it. Moving it after assembly may cause damage.
- Moisture is arguably the most important factor affecting the performance and service life of wood products. The location of your shuffleboard should not be too damp or too dry. A comfortable relative humidity between 30% and 50% is optimal for your shuffleboard.
- Your shuffleboard should be kept in a stable, room temperature environment. The shuffleboard should never be placed in direct sunlight or near a heat source.
- The playfield may swell a little in more humid weather and contract slightly in drier conditions. This can affect the "trueness" of the playfield and should not necessarily be considered a defect. If used properly, the Climatic Adjusters should compensate for these natural occurrences. Refer to Care and Use in the manual for further instructions on using the Climatic Adjusters.
- **Adjustments should be made slowly.** Make half turns to the appropriate nut and allow a day for the table to react. Depending on environmental conditions, the playfield may require days or weeks to completely settle. Making these adjustments too quickly may cause the playfield to crack, permanently damaging your shuffleboard.
- Be aware that your shuffleboard may react to temperature and humidity changes throughout the year. Further adjustments may be necessary to keep the playfield true.

*Following these simple guidelines will ensure many years of enjoyment of your shuffleboard! Please call 800-759-0977 with any questions concerning your table.*
